MESS55, Environmental Studies and Sustainability Science: Political Ecology and Sustainability, 7.5 credits
Miljö- och hållbarhetsvetenskap: Politisk ekologi och hållbarhet, 7,5 högskolepoäng
Second Cycle / Avancerad nivå

Details of approval
The syllabus was approved by The Board of the Lund University Centre for Sustainability Studies on 2017-09-05 and was last revised on 2019-03-14. The revised syllabus applies from 2019-03-15, autumn semester 2019.

General Information
The course constitutes a 3rd term elective (non-compulsory) course at LUMES, Lund University Master’s Programme in Environmental Studies and Sustainability Science, 120 credits.

Language of instruction: English

Main field of studies
Environmental Studies and Sustainability Science

Depth of study relative to the degree requirements
A1F, Second cycle, has second-cycle course/s as entry requirements

Learning outcomes
Upon the completion of the course, the student shall:

Knowledge and understanding
- Be able to in depth discuss key assumptions, central debates and methodological approaches in the political ecological field
- Demonstrate the ability to critically and in a qualified way reflect on how local natural resources use and environmental degradation are connected to wider political economy conditions and global environmental change
Competence and skills

- Demonstrate the ability to systematically and in a qualified way apply political ecology concepts and theories related to power, discourses and biophysical processes to specific sustainability questions and empirical cases,
- Critically and independently reflect on asymmetrical relations of power in environmental issues and the way these are embedded in environmental representations and governance

Judgement and approach

- Demonstrate a critical approach to sustainability issues in an in-depth way that integrates environmental, social, economic and political drivers and dynamics

Course content

The course introduces students to the interdisciplinary field of political ecology as an approach to understand and analyze the interactions between social and environmental change.

The course focuses on the ‘political’ character of sustainability issues, that is, the necessarily power-laden nature of both sustainability problems themselves, and the solutions that are proposed to address them. The course provides an overview of main theoretical concepts, debates and methodological approaches in current political ecology research. The introduction to theoretical debates is complemented with empirical case studies from different parts of the world to illustrate specific thematic focuses. The knowledge acquired in the course is meant to provide one of the theoretical building blocks that students can draw on for their thesis work, and later apply in future work, for instance teaching, research, journalism, environmental and development work.

The course is structured around four key themes, which aim to both give the student an overall understanding of political ecology as approach in relation to questions of sustainability, and provide more in-depth engagements with some of the main topics in contemporary political ecology:

1. Introduction to political ecology
   This theme introduces the course and focuses on the emergence and development of political ecology as an analytical approach (rather than a coherent theory) and provides an overview of fundamental assumptions, concepts, key debates and current streams of political ecology research.

2. Power and social difference in local-global relations
   This theme focus on how multi-scalar analysis can be applied to understand and analyze how environmental degradation and natural resource use at local scales is connected to and influenced by broader political economy conditions and global environmental change processes. It introduces feminist political ecology scholarship and intersectionality as an analytical tool to analyze how overlapping relations of power rooted in class, gender, race and ethnicity shape, and are shaped by, the environment and natural resource use.

3. Environmental narratives and representations
   This theme focuses on critical examinations of environmental narratives and representations of ‘nature’. We will look into questions such as: how are particular sustainability challenges typically represented and who has the power to influence
problem framings? How and why have certain narratives on environmental degradation and change emerged and persisted? And what are the consequences in terms of environmental governance and interventions?

4. Ecology and materiality in political ecology
This theme focuses on potential tensions between material and constructivist perspectives in relation to environmental issues, and ongoing debates on engagements with the ‘political’ and the ‘ecology’ in political ecology scholarship. In this part of the course, we explore the various ways in which political ecology scholarship engage with the biophysical and material dimensions of environmental processes and how these influence how problems are understood and portrayed.

Course design
Teaching consists of lectures, seminars and group exercises. The course is mainly seminar-driven, in which we discuss and engage with texts in depth. Individual and group-based exercises and assignments are combined to stimulate and evaluate students’ ability to conceptualize and analyze specific environmental problems in terms of their interlinked ecological, political, social, and economic dynamics at local to global scales. Theoretical concepts and debates from the course are applied to concrete empirical cases.

Assessment
Course assessment is based on:

- one written individual take-home exam, grading scale Pass-Fail, 0 credits
- one written individual take-home exam, grading scale 5-4-3-F, 4.5 credits
- one written group take-home exam, grading scale 5-4-3-F, 3 credits

The course includes opportunities for assessment at a first examination, a re-sit close to the first examination and a second re-sit for courses that have ended during that school year. Two further re-examinations on the same course content are offered within a year of the end of the course. After this, further re-examination opportunities are offered but in accordance with the current course syllabus.

A student who has taken two examinations in a course or a part of a course without obtaining a pass grade is entitled to the nomination of another examiner, unless there are special reasons to the contrary. Students getting a passing grade cannot re-take an exam or re-submit a paper to get a higher grade.

The examiner, in consultation with Disability Support Services, may deviate from the regular form of examination in order to provide a permanently disabled student with a form of examination equivalent to that of a student without a disability.

Subcourses that are part of this course can be found in an appendix at the end of this document.

Grades
Marking scale: Fail, Three, Four, Five.
The highest grade for the course as a whole is 5 and the lowest passing grade is 3. The grade for a non-passing result is Fail. The student’s performance is assessed with reference to the learning outcomes of the course. The grade 5 denotes outstanding performance in all learning outcomes. The grade 4 signifies very good performance in all learning outcomes. To receive the grade 3, the student must obtain minimum criteria in fulfilling all course learning outcomes. The grade of Fail signifies that the student has not fulfilled the learning outcomes of the course, or that additional work is required before the grade can be awarded.

The first written individual take-home exam is exempted from the grading scale above. The grade awarded for this component is Pass or Fail. For the grade of Pass, the student must show acceptable results. For the grade of Fail, the student must have shown unacceptable results.

At the start of the course, students are informed about the learning outcomes stated in the syllabus and about the grading scale and how it is applied on the course.

Overall course grade:
The grade for the entire course consists of the average grade of all assessed assignments divided by the number of credits awarded for each component*. For a grade of Pass on the entire course, the student must have been awarded at least 3 on all assessments for which the grading scale 5-4-3-F applies, and the grade of Pass on the assessment for which the grading scale Pass-Fail applies.

*The written individual take-home exam is worth 60% (4,5 credits) of the final grade, the written group take-home exam is worth 40% (3 credits) of the final grade.

Entry requirements
To be admitted to the course, students must be admitted to Lund University International Master’s Programme in Environmental Studies and Sustainability Science 120 credits, and have fulfilled course requirements of at least forty higher education credits in the programme.

Oral and written proficiency in English equivalent to English 6/B (advanced) from Swedish upper secondary school is a requirement. International qualifications will be assessed in accordance with national guidelines. International students are exempted from the general entry requirement of proficiency in Swedish.
