

School of Economics and Management

NEKP32, Economics: Mathematical Methods - Dynamic Optimisation, 7.5 credits

*Nationalekonomi: Matematiska metoder - dynamisk optimering,
7,5 högskolepoäng
Second Cycle / Avancerad nivå*

Details of approval

The syllabus is an old version, approved by The Board of the Department of Economics on 2011-06-07 and was valid from 2011-06-07, autumn semester 2011.

General Information

This is a single subject master course in economics. The course is either obligatory or optional within a number of master programmes at Lund University.

Language of instruction: English

Teaching is in English. (Teaching may be in Swedish if all registered students have a good knowledge of Swedish).

Main field of studies

Economics

Depth of study relative to the degree requirements

A1F, Second cycle, has second-cycle course/s as entry requirements

Learning outcomes

Knowledge and understanding

Students shall:

- know and understand the basics of integral calculus for problems with one or more variables,
- be able to solve elementary difference and differential equations for functions of one variable,
- know and understand the classical calculus of variations and Pontryagin's maximum principle for solution of dynamic optimisation problems.

Competence and skills

Students shall have the ability to independently:

- be able to solve problems of integration for functions of one or more variables,
- be able to solve elementary difference and differential equations for functions of one variable,
- be able to use both the classical calculus of variations and Pontryagin's maximum principle in solving dynamic optimisation problems,
- assess the implications of theoretical assumptions for the applicability of the relevant mathematical methods,
- give an account of and discuss their mathematical abilities.

Judgement and approach

Students shall master the relevant mathematical theory in such a way that the student is able to independently gain insights into economic theory based on the mathematical methods and be able to gain insights in more advanced mathematical theory within the areas covered in the course.

Course content

The course deals with the mathematical methods used for analysing dynamic problems in ordinary economic theory. The usage of the mathematical methods is exemplified by a selection of economic problems. The course deals with basic theory of integration for one and more variables. It also contains the theory for linear differential equations of the first order, the theory for linear difference and differential equations of higher order with constant coefficients and the solution of separable differential equations. Finally, the course deals with methods for solving dynamic optimization problems (the classical calculus of variations and Pontryagin's maximum principle).

No specific gender perspective is adopted in this course.

Course design

1. Teaching: Tuition consists of lectures and exercises.

Assessment

1. Examination: Written exams take place at the end of the course. There will be further opportunities for examination close to this date.
2. Limitations on the number of examination opportunities: –

The University views plagiarism very seriously, and will take disciplinary action against students for any kind of attempted malpractice in connection with examinations and assessments. Plagiarism is considered to be a very serious academic offence. The penalty that may be imposed for this, and other unfair practices in examinations or assessments, includes suspension from the University for a specified period.

Subcourses that are part of this course can be found in an appendix at the end of this document.

Grades

Marking scale: Fail, E, D, C, B, A.

1. Grading: The official grading scale is A, B, C, D, E and Fail.
2. Weighting grades from different parts of the course: –
3. Grading scales for different parts of the course: –

Entry requirements

Students admitted to the Master Programme in Economics or the Master Programme in Economic Research Methods and have passed the course NEKN21 "Advanced Microeconomic Analysis" are qualified for this course. For other students, at least 90 ECTS-credits in economics are required. These must include the course NEKN21 "Advanced Microeconomic Analysis" or an equivalent course.

Further information

1. Transitional regulations: This course replaces NEKM47 "Mathematical Methods – Dynamic Optimisation".
2. Limitations in the period of validity: –
3. Limitations: This course may not be included in the same degree as NEK717 "Mathematical Methods – Linear and Dynamic Optimisation" or NEKM47 "Mathematical Methods – Dynamic Optimisation".
4. Similar courses: –
5. Limitations in renewed examination: –
